

Around the World ? Chat Summary

Bay Area iOS beta • Generated 2026-08-12 06:19 UTC

WHAT THIS DOCUMENT IS

Full concrete summary of the Cursor cloud-agent chat for the Around the World pickup-soccer product: decisions, work completed, important changes, and what remains before a real Bay Area phone launch (TestFlight / App Store).

PRODUCT DIRECTION

Brand: Around the World ? Find. Play. Connect.

Colors: Black #0D0D0D, White #FFFFFF, Gold #D4AF37.

Scope: Free Bay Area beta (nine counties). Native iPhone app + Swift Vapor API.

Started as a Lovable TanStack/React web prototype; pivoted to native iOS.

web/ was re-added later only so Cursor/VS Code can run on Linux ? phones ship iOS.

DONE SO FAR

- 1) Native iOS app (ios/AroundTheWorld/) ? SwiftUI tabs: Matches, Map, Host, My Games, Profile, Settings. Bundle id com.aroundtheworld.app, iOS 17+.
- 2) Vapor Backend (Backend/) ? users, profiles, games, participants, friendships. JSON under /api/v1 + GET /health. Default SQLite; optional Supabase Postgres.
- 3) Bay Area geography ? nine counties (SF, San Mateo, Santa Clara, Alameda, Contra Costa, Marin, Solano, Napa, Sonoma) + city lists via GET /api/v1/meta/bay-area. Seed covers major cities/venues across all nine.
- 4) Fully-booked visibility ? browse hides games when joinedCount >= capacity; My Games still shows them; cancellation reopens browse automatically.
- 5) Brand assets ? app icon, LogoMark, Wordmark, AccentColor gold; AppTheme tokens.
- 6) EN/ES localization ? Settings language toggle; L10n / Localizable.strings.
- 7) MapKit on iOS ? browse pins; Host search + pin-drop (no manual lat/lng). Google Places reserved for venue photos only (env key).
- 8) Launch hang fix ? URLSession waitsForConnectivity off, 8s timeouts; location deferred until Map/Host; boot logging subsystem app.aroundtheworld.boot.
- 9) Xcode scheme fix ? BlueprintIdentifier synced after pbxproj regeneration.
- 10) Web client (web/) ? Vite+React for Cursor/VS Code; NOT the phone product.
- 11) Docs ? README, RUN.md, docs/bay-area-beta.md, docs/TESTFLIGHT-CHECKLIST.md.

IMPORTANT CHANGES

- Lovable web prototype -> native iOS + Vapor (App Store / TestFlight path).
- Seed geography Brooklyn NY -> full nine-county SF Bay Area.
- Full listings use roster math (joinedCount vs capacity), not a hidden flag.
- Local API defaults to SQLite + SEED_DEMO for easy Mac/dev; production needs DATABASE_URL (Supabase).
- web/ added for IDE convenience; launch path for users is still the iOS app.
- Simulator hang / broken Xcode Run scheme diagnosed and fixed on main.

LEFT BEFORE LAUNCH (TESTFLIGHT)

BLOCKERS (must):

1. Auth ? Sign in with Apple and/or Supabase Auth + JWT middleware on Vapor so Claim Spot, My Games, Host publish, and Profile work for real users.
2. Hosted HTTPS API ? deploy Backend with Supabase Postgres; never ship

127.0.0.1 to testers.

3. Apple Developer Program (\$99) + App Store Connect app record + signing Team.
4. Production secrets ? real SUPABASE_URL, SUPABASE_ANON_KEY, SUPABASE_JWT_SECRET, API_BASE_URL, optional GOOGLE_PLACES_API_KEY (none committed; placeholders only).
5. Device QA ? physical iPhones via TestFlight against hosted API.

SHOULD-HAVE before wider beta:

6. Final logo on App Icon / splash / nav BrandHeader.
7. Profile UI polish to match Lovable screenshots (fields already: age, skill, position, bio, based-in).
8. Privacy Nutrition Labels, location purpose review, age rating (marketed 4+).
9. Host Publish fully wired after auth.
10. Enough real or seeded Bay Area hosts so map/list are not empty on day one.

LATER / OPTIONAL: push notifications, payments hardening, friends graph, public App Store listing polish.

HOW TO RUN TODAY

Mac local (API + optional web):

```
./scripts/run-backend.sh  
open ios/AroundTheWorld/AroundTheWorld.xcodeproj # Run on iPhone simulator  
# or Cursor/VS Code convenience: ./scripts/dev.sh -> http://127.0.0.1:5173
```

Smoke API: ./scripts/smoke-api.sh

Default API: http://127.0.0.1:8081

READY-FOR-TESTFLIGHT BAR

A stranger on an iPhone can install via TestFlight, sign in, see Bay Area games on map/list, claim a spot, and host a session ? all against a cloud HTTPS API, with no laptop backend running.

REPO MAP

ios/AroundTheWorld/	? native SwiftUI app (the phone product)
Backend/	? Swift Vapor JSON API
web/	? Vite React (Cursor/VS Code only)
scripts/	? run-backend.sh, dev.sh, smoke-api.sh
supabase/	? optional SQL migrations
docs/	? architecture, Bay Area beta, TestFlight checklist

CHAT THREAD HIGHLIGHTS (CHRONOLOGY)

1. Connected brand style guide; integrated app icon + logos on main.
2. Bay Area beta backlog: hang diagnosis, roster visibility, real data, Settings EN/ES, MapKit, logo/profile blocked on assets, API key audit.
3. User asked to run in emulator here ? Linux cannot run iOS Simulator; fixed Xcode scheme ID + ran API smoke locally.
4. User wanted any-IDE (Cursor/VS Code) ? added web/ + expanded 9-county seed.
5. Clarified: phone product is iOS; listed concrete TestFlight launch steps.
6. This PDF ? concrete summary of done / left / important changes.
